Wind Tunnel Testing - Glenn Research Center In some wind tunnel tests, the model is instrumented with pressure taps and the component performance is calculated from the pressure data. Total pressure measurement is the normal procedure for determining aircraft inlet performance. Wind tunnel - Wikipedia A wind tunnel is a tool used in aerodynamic research to study the effects of air moving past solid objects. A wind tunnel consists of a tubular passage with the object under test mounted in the middle. Air is made to move past the object by a powerful fan system or other means. Wind Tunnel Testing - Prototyping Solutions Windâ€™tunnel testing is an integral part of the design process in many industries, typically used to verify and tune the aerodynamic properties of solid objects. Whether an object is stationary or mobile, wind tunnels provide insight into the effects of air as it moves over or around the test model.

How Effective is Your Aero? - Wind Tunnel Testing a Nissan 350Z Curious to see how changes to aerodynamic devices like a front splitter and rear wing affect downforce on a stock bodied Nissan 350Z race car?. Wind Tunnel - NASA Aerodynamicists use wind tunnels to test models of proposed aircraft. In the tunnel, the engineer can carefully control the flow conditions which affect forces on the aircraft. By making careful measurements of the forces on the model, the engineer can predict the forces on the full scale aircraft.
